

PACKETS2DISK: INTRODUCTION

Financial institutions around the world use the Packets2Disk software to capture, decode and analyze market and trading data. Ultimate flexibility in input, output and functionality combines with customisable analytics and reporting, together with an intuitive management GUI for ultimate control and performance.

- Capture all data from multiple sources across the network
- Decode both market and trading data, with support for all major protocols
- Analyze and report on captured and decoded data as needed
- Export in multiple data formats across a wide range of databases
- Easily manage and configure the network with the P2D intuitive GUI

Show packet inputs for:		Show packet sources for:	
All servers		All servers	
Packet Inputs	vLAN Filters	Timestamp Methods	Packet Sources
pcap-file-PIX.pcap (primary-server)	vlan1-343		PIX.pcap-343 (primary-server)
pcap-file-millennium.pcap (primary-server)			millennium.pcap (primary-server)
pcap-file-mil1.pcap (primary-server)			mil1.pcap (primary-server)

Packets2Disk enables the capture, decode, analysis and export of trading and market data. Nano-second accuracy of timestamps provides a highly accurate, independent record of financial data to meet both internal business analytics and external regulatory compliance requirements. All major financial protocols are supported, and an in-built API enables custom decodes to be implemented as required.

Data is captured directly from the wire and decoded in real-time. The data is then made available for analysis with in-house or external analytics platforms, as well as for internal storage and export to external databases, with all major formats supported. All functionality is configured and managed through the intuitive, easy to use, drag and drop P2D management GUI, which provides business-wide access to and viewing of all detail of traffic flows and capture, as well as traffic filtering and reporting functionality.

With its multi-core, multi-threaded software-only platform, the P2D solution is deployed on industry-standard hardware, combining minimal deployment overhead with maximum flexibility and ease of use, for unbeatable performance and cost-effectiveness.
